

STAT-S 610 Lab 6: Code Review II

November 11, 2022

In this lab, we will practice going through the entire code review process.

Setup

1. Review the material from [lab 5](#) to get reacquainted with the code review process.
2. One member of the group should have a GitHub repository to practice with. This can be from your final project. If you do not have one for this lab, create it and add your group members as collaborators.

Create a pull request

1. Following the steps outlined in lab 5, create a new branch, make changes to the repository, and push to GitHub to create a new pull request.
2. Add your collaborators as reviewers to the pull request. The reviewers can make comments and request changes based on mistakes or inconsistencies that they see in the code.
3. Commit and push new changes based on comments from reviewers.

Merge

1. Once everyone is happy with the changes, click on “merge” to merge the pull request to the main branch.
2. In the terminal, each group member should type `git checkout main` and `git pull` to update the main branch in their local repositories to reflect the merge.
3. Clean up by deleting the branch on GitHub and in your local repository.
